

BUZZER BATTLES

READ BELOW:

OVERVIEW:

This game was made in about a week with a maximum of a month of experience. It was made by a bunch of high schoolers for a class project. Thank you for the interest you have shown in the game as me and my team highly appreciate it. This project may be edited upon to fit your needs. Both the main script file and a Doc of the script are provided, and are named “**Game_Controller.ino**” and “**BuzzerBattles-Game_Controller_Doc**” respectively.

BUZZER BATTLES

GAME INSTRUCTIONS:

The game's premise is to have a faster reaction time than the other player. The game is played by **2 players**; there is a team for each player: yellow, and green. The game consists of **5 rounds** and will restart after the game ends with **setting both team scores to 0**. Each player has their own button which can be pressed. Each team also has their own light which will light up when the score has increased for that color respective team. The button should be pressed when the main LED, the light on the side, lights up solid red or green.

There is a main LED that has two light states, solid and flashing, and will emit different colors.

MAIN LED COLORS:

- **Red (Solid)** - When a button is pressed by any player during this phase, the player that pressed their button will lose 1 point and the buzzer will buzz for a couple seconds.
- **Green (Solid)** - The first player to press their button on this phase will receive 1 point.
- **Blue (Solid)** - All five rounds have been played and will restart the game shortly after.
- **Green (Flashing)** - Green team has won the game and the game will restart after.
- **Yellow (Flashing)** - Yellow team has won the game and the game will restart after.

BUZZER BATTLES

FINAL NOTES: The game will print out messages like round status and FINAL SCORES throughout the game. To see the messages, connect the game circuit board to a computer with the Ardurino IDE with the SERIAL MONITOR open.

*****The game has an anti-cheat embedded to prevent players from holding the buttons for too long. If the game is not progressing, make sure both buttons are not held down to go to the next round. If the game breaks or if you would like to perform a reset, either disconnect ardurino circuit board from power or press the red reset button on the circuit board itself.*****
